

Instruction

- ∞ After receiving the kit. Put the host plant in refrigerator (Vegetable box). Be careful of ants, do not leave the box opened. Keep the box in cool and dry room (A/c is the best), do not put the box in direct sunlight.
- ∞ clean the box by empty stool at least every 1-2 days, always count the number of caterpillars every time. Feed only 1 bundle of plant. If there are some caterpillars left on the old branch, that's ok. They will walk to new branch.
- ∞ Do not touch caterpillars when they are molting or turning into pupa, you will notice that they are motionless, cease feeding and in the preparing posture. Pupa process will not be completed if it has been interfered. cleaning can be skipped if pupa process is not completed yet. This could be 1-2 days.
- ∞ When all caterpillars turn into pupas, empty all stools and host plant. Put the net in diagonal of the box and a tissue paper underneath. Always close the lid and wait. When butterflies come out of their pupas, their wings are wet and needed to be dry in first 1-2 Hr., Do not touch them at this moment. Wait them to dry their wings properly. usually they come out in the morning, so please check them regularly.
- ∞ ** Tips: dip your finger in syrup or sweet fruit juice, butterflies will climb to your finger easily. After taking photos, let them go by leaving them around a tree.
